

New AASPI Algorithms: March 2016	
Application Name	Application Description
aaspi_corender	GUI and python script that allows co-rendering of two attributes as vertical slices or time slices using two different color bars and alternative transparency constructs
aaspi_echo_error	This little GUI simply echos a message in a pop-up window that previously showed up in the *.out file. Many of our users, particularly running on Windows, did not realize this is where the errors would appear. At present, we pop this error up in the conversion python script. We will move it to other scripts as appropriate.
skeltonize3d	Uses the output of fault_enhancement to further sharpen and desired discontinuity or unconformity. Skeletonization is done perpendicular to the plane surfaces defined by their dip and azimuth
