Summary

The high-resolution processing of the timefrequency analysis plays a vital role in the identification of the thin layer. Our goal is to squeeze the seismic events and separate the thin Generalized S Synchrosqueezing layer. (SSGST) is a novel signal Transform decomposition method that provides several useful characteristics by squeezing the signal and extracting the isofrequency component. However, in the real application for processing field data, this method cannot guarantee the lateral continuity of seismic data, and different isofrequency component selection has a significant influence on energy focusing effect of seismic events. We address this shortcoming of the previous method by constructing a Multichannel synchrosqueezing generalized S transform (MSSGST) method that preserves lateral continuity. And this method can adaptively extract the extremum of the frequency component which always keeps the energy of the seismic events the strongest. Moreover, this method combining the geological characteristics with multichannel data for squeezing, so it has high-resolution and continuity in both lateral and vertical direction.

Method

The equation of the Generalized S Transform is

$GST(f,\tau) = \int_{-\infty}^{+\infty} h(t) \frac{ f ^{\gamma}}{\sqrt{2\pi\rho}} \exp\left[\frac{ f ^{\gamma}}{\sqrt{2\pi\rho}} \exp\left[\frac{ f ^{\gamma}}{\sqrt{2\pi\rho}}\right] + \frac{ f ^{\gamma}}{\sqrt{2\pi\rho}} \exp\left[\frac{ f ^{\gamma}}{\sqrt{2\pi\rho}} \exp\left[\frac{ f ^{\gamma}}{\sqrt{2\pi\rho}}\right] + \frac{ f ^{\gamma}}{\sqrt{2\pi\rho}} \exp\left[\frac{ f ^{\gamma}}{\sqrt{2\pi\rho}} \exp\left[\frac{ f ^{\gamma}}{\sqrt{2\pi\rho}}\right] + \frac{ f ^{\gamma}}{\sqrt{2\pi\rho}} \exp\left[\frac{ f ^{\gamma}}{\sqrt{2\pi\rho}} \exp\left[\frac{ f ^{\gamma}}{\sqrt{2\pi\rho}}\right] + \frac{ f ^{\gamma}}{\sqrt{2\pi\rho}} \exp\left[\frac{ f ^{\gamma}}{\sqrt{2\pi\rho}} \exp\left[\frac{ f ^{\gamma}}{\sqrt{2\pi\rho}}\right] + \frac{ f ^{\gamma}}{\sqrt{2\pi\rho}} \exp\left[\frac{ f ^{\gamma}}{\sqrt{2\pi\rho}} \exp\left[\frac{ f ^{\gamma}}{\sqrt{2\pi\rho}}\right] + \frac{ f ^{\gamma}}{\sqrt{2\pi\rho}} \exp\left[\frac{ f ^{\gamma}}{\sqrt{2\pi\rho}} \exp\left[\frac{ f ^{\gamma}}{\sqrt{2\pi\rho}}\right] + \frac{ f ^{\gamma}}{\sqrt{2\pi\rho}} \exp\left[\frac{ f ^{\gamma}}{\sqrt{2\pi\rho}} \exp\left[\frac{ f ^{\gamma}}{\sqrt{2\pi\rho}}\right] + \frac{ f ^{\gamma}}{\sqrt{2\pi\rho}} \exp\left[\frac{ f ^{\gamma}}{\sqrt{2\pi\rho}} \exp\left[\frac{ f ^{\gamma}}{\sqrt{2\pi\rho}}\right] + \frac{ f ^{\gamma}}{\sqrt{2\pi\rho}} \exp\left[\frac{ f ^{\gamma}}{\sqrt{2\pi\rho}} \exp\left[\frac{ f ^{\gamma}}{\sqrt{2\pi\rho}}\right] + \frac{ f ^{\gamma}}{\sqrt{2\pi\rho}} \exp\left[\frac{ f ^{\gamma}}{\sqrt{2\pi\rho}} \exp\left[\frac{ f ^{\gamma}}{\sqrt{2\pi\rho}}\right] + \frac{ f ^{\gamma}}{\sqrt{2\pi\rho}} \exp\left[\frac{ f ^{\gamma}}{\sqrt{2\pi\rho}} \exp\left[\frac{ f ^{\gamma}}{\sqrt{2\pi\rho}}\right] + \frac{ f ^{\gamma}}{\sqrt{2\pi\rho}} \exp\left[\frac{ f ^{\gamma}}{\sqrt{2\pi\rho}} \exp\left[\frac{ f ^{\gamma}}{\sqrt{2\pi\rho}}\right] + \frac{ f ^{\gamma}}{\sqrt{2\pi\rho}} \exp\left[\frac{ f ^{\gamma}}{\sqrt{2\pi\rho}} \exp\left[\frac{ f ^{\gamma}}{\sqrt{2\pi\rho}}\right] + \frac{ f ^{\gamma}}{\sqrt{2\pi\rho}} \exp\left[\frac{ f ^{\gamma}}{\sqrt{2\pi\rho}} \exp\left[\frac{ f ^{\gamma}}{\sqrt{2\pi\rho}}\right] + \frac{ f ^{\gamma}}{\sqrt{2\pi\rho}} \exp\left[\frac{ f ^{\gamma}}{\sqrt{2\pi\rho}} \exp\left[\frac{ f ^{\gamma}}{\sqrt{2\pi\rho}}\right] + \frac{ f ^{\gamma}}{\sqrt{2\pi\rho}} \exp\left[\frac{ f ^{\gamma}}{\sqrt{2\pi\rho}} \exp\left[\frac{ f ^{\gamma}}{\sqrt{2\pi\rho}}\right] + \frac{ f ^{\gamma}}{\sqrt{2\pi\rho}} \exp\left[\frac{ f ^{\gamma}}{\sqrt{2\pi\rho}} + \frac{ f ^{\gamma}}{2\pi$	$\frac{(t-\tau)^2 f^{2\gamma}}{2\rho^2}$	$\left \exp(-i2\pi ft)dt\right $
---	--	----------------------------------

The instantaneous frequency expression of the signal in SSGST is defined as

$$\widetilde{f}(f,\tau) = f + [i2\pi GST(f,\tau)]^{-1} \frac{\partial GST(f,\tau)}{\partial \tau}$$

Based on the instantaneous frequency, the Synchrosqueezing Generalized S Transform is defined as

We then calculate the maximum energy value of the frequency in each time point to reconstruct new data which is obtained according to the formula

$$ESSGST(f_{\max},\tau) = SSGST(\max(\tilde{f}_c),\tau)$$

We finally squeeze multichannel data in a window to get the high resolution data.

 $MSSGST_{x(n)}(f_E,\tau) = \frac{1}{l+1} \sum_{n-\frac{l}{2}}^{n+\frac{l}{2}} ESSGST_{x(n)}(f_{\max},\tau)$

Conclusions

We propose the MSSGST for the high-resolution processing of seismic signal. Inheriting the merits of SSGST, MSSGST not only can improve the energy focusing but also enhance the continuity of the seismic events. And we can use the algorithm to calculate the maximum energy value of the frequency component adaptively that improves the universality of the method.

Acknowledgment

We express our gratitude to all the sponsors of the Attribute-Assisted Seismic Processing and Interpretation (AASPI) Consortium for their generous sponsorship. We thank the support by the Key Lab of Earth Exploration and Information Techniques of Ministry of Education in Chengdu University of Technology and we also thank CNOOC Research Institute for providing the data and support.
